03. Radius of Gyration of all Molecular Structures :

Alpha Helix

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

Beta Sheet

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

TRP Cage

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

Radius of gyration (total and around axes)

As we know, natural proteins (1PGB and TRP Cage) have a more complex 3-dimensional structure compared to that of designed peptides. Also, as our designed peptides are selective thus they are more specific and particular in terms of shape and size. For e.g. - Alpha Helix has a defined spiral shape. Thus, we can observe that their Radius of Gyration values are low compared to those of natural proteins. Also, since natural proteins have more random shape and structure, their Rg values are also higher.

04.

1PGB :	300K : Found 4 clusters 363K : Found 85 clusters
Alpha-Helix :	300K : Found 2 clusters 363K : Found 58 clusters
Beta-Sheet :	300K : Found 3 clusters 363K : Found 272 clusters
1L2Y :	300K : Found 3 clusters 363K : Found 101 clusters
TRP-Cage :	300K : Found 3 clusters 363K : Found 150 clusters

05. Free Energy Landscape of 1PGB at 363K

Average structure of 1PGB.pdb at 363K (cluster.pdb)

Average structure aligned with 1PGB.pdb original structure along with RMSD value :

Inference :

The analysis allows deduction of the key conformational states of 1PGB and their interconversion. The free energy landscapes exhibit the energy barriers and pathways between these different states. The average structures of each cluster can give an idea about the changes in protein conformation and how it associates with its function. This explains the relation of the molecule's structure with its function.
